

The SMARTree client and GIT cloud can be used to store basic employee data including work addresses, email and contact numbers. These employee information trees can be pulled to active projects, test matrices or active production workflows using the free format drag and drop feature within the client. GIT synchronization ensures the data is up to date across the entire organization. Human resources can manage these employee trees and ensure they are available on the intranet or business cloud for researchers or scientists to assign to project trees. Below is an example of an employee tree for John Smith.

John Smith employee Information		
Name	Text	John Smith
Employer	Text	Comp Tech Inc.
Organization	Text	
Department	Text
