

The Resize Feature

The user can resize each window with the resize button shown below. Left click and hold the mouse button while dragging and resizing all windows. Releasing the mouse stops the resize function. There is also a minimum size for the libraries and SMARTree preview window.

The Resize Button

View Levels Feature

On the top of each tree in the main GUI is a “Levels” Slider (shown below) that allows the user to expand or contract levels with the adjacent tree window. This feature is useful and hiding or showing various levels without having to manually click each level to open or close. Selecting a sub tree and changing the Levels slider will only expand or contract that particular section. The entire tree is activated with a single item that has no sublements is selected.
